

A 'mixture' is something that is physically joined together but can be separated again.

Knowledge Organiser Unit: States of Matter

Dissolving

The item being dissolved is

The substance dissolving it is

When the solvent can dissolve

no more of the solute, it is

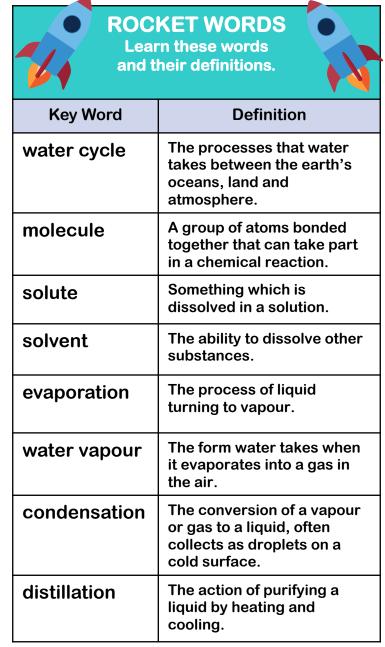

the solute.

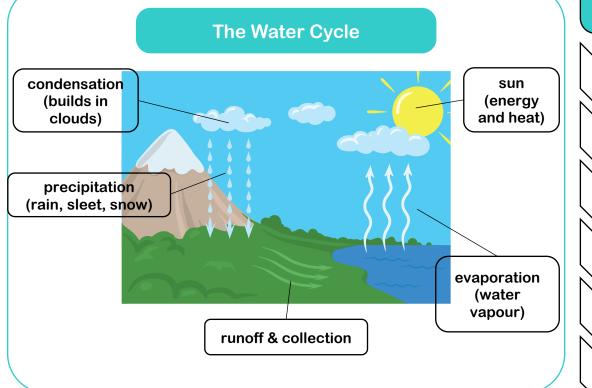

called the solvent.

called 'saturation'

Mixtures can be separated in so many ways – such as evaporation, distillation, filtering and absorption.

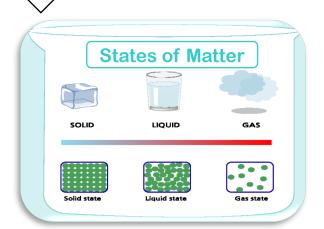

and gases

Diluting

- This process reduces the concentration of a solute in a solution.
- Takes place by adding more of the solvent to the solute.
- A good example of this is adding more water to orange squash.

IT LESSONS

Compare and group solids, liquids

temperature on changing state

Understand dissolving and diluting

Investigate the effect of

Explore evaporation and

Understand the water cycle

Describe freezing and melting

condensation
